

Desi Dhamaka Website & Admin CMS

Complete project summary — July 2, 2026

Executive summary

We built and deployed a full multi-location restaurant website with a content management system (CMS) for Desi Dhamaka. The public site serves South Plainfield, Old Bridge, and Lawrenceville with location-aware menus, homepage content, offers, gallery, reservations, and reviews. The admin dashboard lets staff update all content without touching code.

The system is live on Netlify today, connected to Supabase (PostgreSQL, Auth, Storage). Recent work added page-level CMS, fixed hero CTAs and a blank-homepage bug, and moved the hero video off Supabase to cut bandwidth costs. Ready for stakeholder review before production domain cutover (desidhamakanj.net).

What was built

Part	Purpose	Users
Public website	Menu, gallery, offers, reservations, contact	Customers
Admin dashboard	Manage content, analytics, pages, homepage	Staff / managers
Multi-location	Separate content per SP, OT, Lawrenceville	All locations

Technology stack

Layer	Technology
Frontend	React 18 + TypeScript + Vite + React Router
Hosting	Netlify (HTTPS, global CDN, static hero video)
Backend	Supabase (PostgreSQL, Auth, Storage, RLS)
Integrations	ChefGaa online ordering URLs per location
Source code	GitHub: arunsaikumarB/dd3-restaurant-cms

How it works

Customer visits public site !' Netlify serves SPA !' LocationProvider picks outlet !' content loads from Supabase.

Staff logs in at /admin/login !' Supabase Auth !' admin role check !' edits in dashboard !' changes save to Supabase !' public site reflects updates within ~60 seconds.

Work completed — foundation through Phase 20

Phase	Deliverable
Foundation	Public pages + admin UI wired to Supabase
Phase 15	Row Level Security, hardened auth, safe user provisioning
Phase 16	Admin-only dashboard; staff access denied by design
Phase 17	Footer/contact/reservations from Settings; smoke test docs
Phase 18	Launch checklist (infra, SEO, security)
Phase 19	Meta tags, JSON-LD, sitemap, robots.txt
Phase 20	Demo deployment on Netlify + env configuration

Phase 21 — Multi-location CMS

- Three locations: South Plainfield (SP), Old Bridge (OT), Lawrenceville (LV)
- Per-location homepage_content, settings, menu rows, and order URLs

- Location-scoped CRUD in admin; public reads filtered by selected location
- Migrations 007–011: location tables, isolation, CMS-first public reads
- Menu seeds: 377+ items for SP; correct prices and ChefGaa order_type per outlet

ChefGaa, offers, gallery & analytics

- ChefGaa integration: location-specific ORDER NOW URLs (order_type 106/108/LV menu link)
- Homepage signature dishes wired to chef_special menu items + carousel restore
- Offers CMS with banner images, date ranges, and offer detail pages
- Gallery CMS redesign: sections, featured/visible toggles, location scoping
- Analytics dashboard: page views, offer clicks, reservation funnel (migrations 022–023)

Page content CMS — Phases 1–3

Phase 1 — Content audit & database

- CONTENT_AUDIT.md: mapped all hardcoded public copy to CMS keys
- Migration 024_page_content.sql: 171 rows across About, Contact, Menu, Offers, etc.
- pageContentSchema.ts: typed section/field definitions for validation

Phase 2 — Public site wiring

- PageContentProvider loads page_content from Supabase per location
- All public pages read CMS text with sensible fallbacks if DB empty
- Gallery redesign and analytics tracking integrated in same release

Phase 3 — Admin Pages CMS

- New /admin/pages route with section-based forms
- Homepage admin extended with additional tabs (hero, about, signatures, etc.)
- pageContentAdmin.ts service for CRUD; validation mirrors public schema

Phase 4 — Homepage hero CTAs (migration 025)

Replaced misused cta_text/cta_link fields with separate primary and secondary CTA label + URL pairs. Admin now shows Label and URL fields; public hero buttons display readable labels, not raw URLs.

Location	Primary CTA	Order URL pattern
South Plainfield	Order Now	ChefGaa order_type=106
Old Bridge	Order Now	ChefGaa order_type=108
Lawrenceville	Order Now	orders.chefgaa.com LV menu

- Files updated: Hero.tsx, HomepagePage.tsx, homepageContent.ts, homepagePublic.ts
- Commit ae0aad2 — Fix homepage hero CTAs with separate label and URL fields

Production fixes — blank homepage & bandwidth

Blank public site (commit 90fa65c)

Root cause: usePageTracking() ran in PublicSiteShell before LocationProvider, throwing useLocationSelection must be used within LocationProvider and leaving #root empty. Fix: new PublicSiteChrome component inside providers calls usePageTracking().

Supabase bandwidth reduction (commit 3e30d63)

Hero video was ~45 MB × 3 locations served from Supabase Storage, exhausting the 5 GB egress quota. Compressed to 720p CRF 28 (~8.13 MB), hosted at /media/hero.mp4 on Netlify CDN.

- Migration 026: sets hero_video=/media/hero.mp4 for all locations
- Removed legacy 16 MB videoplayback.mp4; all fallbacks point to /media/hero.mp4
- Gallery uploads resized (max 1920px, 80% JPEG/WebP) before Supabase upload
- Storage cacheControl raised to 31536000 (1 year) for new uploads
- Admin tip on hero video field: prefer Netlify static URL over Supabase for large files

Live URLs

Resource	URL
Public site	desi-dhamaka-admin.netlify.app
Admin login	.../admin/login
Homepage CMS	.../admin/homepage
Pages CMS	.../admin/pages
Hero video	.../media/hero.mp4 (~8 MB)
GitHub	github.com/arunsaikumarB/dd3-restaurant-cms

Database migrations (latest)

Migration	Purpose
024	page_content table + 171 seed rows
025	Hero primary/secondary CTA label + URL fields
026	Hero video !' /media/hero.mp4 local path
021–023	Gallery CMS, analytics tables
007–011	Multi-location isolation

Issues resolved during setup & launch

Issue	Resolution
Invalid login credentials	Switched to legacy anon API key; redeployed
Access denied in admin	Set user role = admin in database
public.users missing	Ran all migrations; created admin profile
Blank homepage	Moved page tracking inside LocationProvider
Supabase egress 100%	Hero video off Supabase !' Netlify static asset
Wrong order URLs	Per-location ChefGaa order_type corrected in CMS

What the admin can manage today

Area	Capabilities
Homepage	Hero video/image, title, CTAs, about, signature dishes
Pages	About, Contact, Menu intro, Offers, Reservations copy
Menu	Categories, items, prices, images, chef specials, active flag
Gallery	Sections, uploads, captions, featured/visible per location
Offers	Promotions, banners, dates, detail page content
Reviews	Approve/reject customer submissions
Reservations	View and manage booking requests
Settings	Name, phone, email, address, hours, logo, social links
Analytics	Dashboard with traffic and conversion metrics

Security

- Email + password required for admin access
- Only admin role can use the dashboard
- Row Level Security on database tables
- Service-role keys not exposed in frontend
- Admin area blocked from search engines

Current status

Item	Status
Demo site live	Complete
Multi-location CMS	Complete
Page content CMS	Complete

Hero CTAs + video fix	Complete
Admin CMS working	Complete
Database & storage	Complete
SEO basics	Complete
Production domain	Not yet connected (demo only)

Recommended next steps

- Populate remaining content via admin (menu, pages, gallery per location)
- Stakeholder review on demo URL
- Connect desidhamakanj.net/lawrenceville to Netlify when approved
- Delete orphaned Supabase hero-video objects to reclaim storage
- Create staff accounts with appropriate roles
- Run final QA / smoke test on production URL

One-liner for leadership

"We delivered a modern multi-location restaurant website with a secure admin CMS — including page-level content editing, location-aware menus and ordering, analytics, and a live Netlify deployment. We fixed production issues (blank homepage, hero CTAs, Supabase bandwidth) so the team can manage all three outlets without developers, ready for content fill and production domain switch when approved."
